HSMA Session 3D: Exercise 3

In your groups, you're going to work on a bit of analysis for a stakeholder.

They're having to close 3 of 10 clinics that currently serve an area.

They want to understand which is going to have the lowest overall impact on service users.

You can use any combination of Python maps, QGIS maps, graphs, summary statistics, and anything else to make your case.

You have been provided with a precalculated travel matrix and several additional useful datasets and shapefiles to get you started, but you can use anything else you think would be relevant too.

You want to provide decision support for the stakeholder.

The outputs can be any combination of notebooks, slide decks, or other outputs.
